Large Desktop - 1920 x 1080

Small Desktop - 1366 x 768

This document provides information about the new/improved features and production bug fixes delivered in the Mintec Analytics v4.3.1 release.

What's Changed

## The ability to sell/subscribe to individual price forecasts

The key feature of this minor release addresses a commercial need to allow clients to subscribe to individual price forecasts, in addition to the existing options of all forecasts or at the forecast category level. When setting up a forecast subscription, the back-office system has been updated for individual price forecast selection.

Any clients subscribed to individual forecasts will see differences in Mintec Analytics, as follows:

Forecast Overview & Search

o On the forecast overview screen, you will see the categories and forecasts you are subscribed to.

o The Forecast search screen will show all the forecast categories/commodities in the facets on the left.
   Any commodities you are not subscribed to will be displayed with a lock in the search results.

Forecast Alert Notification

o You will receive forecast alert notifications only for the price forecasts in your subscription.

o The ability to personalise alerts via Alert Centre is restricted to those categories/price forecasts within your subscription.

Weekly Digest: Only subscribed-to forecast commodities are listed in the Weekly Digest search selection.

Forecast Add-In and API allow the download of price forecast data the client has subscribed to. An error message is received if you try to download anything outside of your subscription.

Bug Fixes:

BUG #1: Previously, it was not possible to add an imported index series to a cost percentage model. This has been fixed.

BUG #2: When exporting a cost model as PDF/PNG, any pinned values or text boxes didn't show in the download – this has been fixed.

BUG #3: Sometimes forecast categories were not displayed in the correct order on the Forecast Overview screen. This is now being handled correctly.

BUG #4: A number of translations have been corrected.

BUG #5: The issue when opening the weekly digest video from the mobile app has been fixed.

Additional information:

New forecast addition: New forecast Pork US is now available in the Animal Products category.
